

# SCIS UK

**Have you ever** wondered why your PC crashes so much? Maybe your PC has just started crashing occasionally and you waste lots of time installing and uninstalling software, looking for a problem?

**Have you ever** considered that maybe your computer crashes so much because it wasn't built properly in the first place?

**Have you ever** seen a cheap computer on an online auction and been toying with the idea of buying that?

Every SCIS UK Limited computer that is sold contains only quality parts, made by manufacturers such as those on the left.

In doing this we know that it's new owner is going to have a pleasant time using it - instead of spending their time wondering whether they should throw it out of the nearest window.

So what is the difference between branded parts, such as the ones we use - and unbranded parts contained in computers you may see going cheap on an online auction or sold down the pub?

Quite simply - unbranded parts are much cheaper and a lot less reliable - for example a stick of unbranded memory looks the same as a branded stick of Kingston memory that we use, but there is a lot of difference.

With unbranded memory, more often than not at some point around 60% is returned as faulty. With branded memory such as Kingston - you are lucky if you get a faulty piece.

On top of these factors, when buying an SCIS UK Limited computer system or base unit, you can be sure that the system has been custom built for you!

We see so many people that have been sold things they don't need - that is why when you come to us we will only include a digital camera or scanner if that is what you need.

We can deliver PC's to anywhere in the UK. Carriage charges may apply.
